Project Overview

The Salon Appointment System is a secure, scalable full-stack solution that centralizes salon operations across web and mobile platforms.

Key Objectives:

- Role-based authentication (bcrypt))
- Real-time appointment handling
- Multi-salon scalability (Flutter App)
- Strong database integrity

Technology Used

Website

App

System Architecture Flow

Full-Stack Multi-Salon Management System Web Application

Website

App

Advantages

- Data isolation per salon
- Separate admin control
- Independent branch management
- Franchise-level scalability
- It provides Centralize Salon Booking with role based login

Future Scope

- Online payments
- Notifications & analytics

Limitations

- System is not tested for very high number of users
- No automatic data backup system implemented yet.
- Limited protection against cyber attacks
- Does not support offline booking

Screenshots

Conclusion

- Successfully developed a hybrid full-stack salon management system integrating a Web Admin Panel (Node.js + MySQL) and a Flutter Mobile App (Supabase-based authentication and services).
- Implemented strong DBMS principles in the web system including normalization, foreign keys, triggers, audit tables, and role-based access control to ensure data integrity and security.
- Designed the system with multi-salon scalability, enabling branch-wise data isolation and independent admin management.

Thank You
